

# History, materials and techniques of motor-vehicle painting between 1900 and 1945

with special focus on pyroxilin-based automobile coatings

Dissertation at the Staatlichen Akademie der Bildenden Künste Stuttgart

Institut für Technologie der Malerei

submitted by Gundula Tutt

under the supervision of Prof. Dipl.- Rest.Volker Schaible

## Contents

### Foreword

### Acknowledgements

#### 0. Contents

#### I. Introduction

##### 1. Structure of this research

##### 2. Starting points

##### 3. Current state of research and objective

##### 4. Literature and sources

4.1. Published sources: historical reference books, periodicals and company publications

4.2. Unpublished sources: archive materials

4.3. Professional literature from the automobile and chemical industry

#### II. Basic principles

1. Basics on historic vehicle body construction
  - 1.1. Overview on the development of autobody construction up to World War II
  - 1.2. Comparing the special features of European and American autobody construction
2. Development of the Chemical Industry at the beginning of the 20th century
  - 2.1. Germany and Europe
  - 2.2. United States of America
3. Basic principles of the coating practices for autobodies

### III. The history of motor vehicle coating materials

1. Painting the motorcoach: Oil based coating materials
  - 1.1. Chemical backgrounds of oil based materials
  - 1.2. Formulations and production of oil based vehicle coating materials
  - 1.3. Layer buildup and application of vehicle coatings with oil based coating materials
  - 1.4. Refinishing with oil based coating materials
  - 1.5. Characteristics and limitations of oil based coating materials
2. Alternatives to oil based paints before World War I
  - 2.1. **Fast-drying "baking-japans": "So long as it is black"**
    - 2.1.1. The demands of industrial production concerning vehicle paints
    - 2.1.2. The application of baking japans on automobiles
    - 2.1.3. Refinishing of vehicles coated with baking japans
  - 2.2. **War Paint: scarcity of raw materials and the development of surrogates between 1914 and 1918**
    - 2.2.1. Surrogates for copal resins and amber
    - 2.2.2. "Oilfree basecoats"
    - 2.2.3. Surrogates for natural turpentine
3. Advancements of oilbased coating materials after World War I
  - 3.1. Chinese wood oil as coating material
  - 3.2. New drying agents
  - 3.3. Fast-drying paints containing chinese wood oil for motor vehicle use
4. "Factor-process": a method to speed up the coating of vehicle bodies
5. Another way to reduce expenses in automobile coating: Fabric and "Weymann" bodies
6. After war ended in 1918: the explosives industry looks for new products
  - 6.1. Initial points
  - 6.2. Paint materials based on cellulose nitrates
  - 6.3. Diversification of the Cellulose Nitrate Industry and research for new materials
  - 6.4. "Low viscosity" pyroxilin materials
  - 6.5. DUCO Automobile Lacquer

## **7. International propagation of pyroxilin vehicle coating materials**

### **7.1. Changes in the USA**

- 7.1.1. The effects of American innovation in the European paint industry with particular reference to Glasurit Werke Heinrich Winkelmann AG
- 7.1.2. Other German paint producers

### **7.2. Special products and special applications**

### **7.3. Further development in the field of pyroxilin vehicle paints during the 1930s**

## **8. The application of pyroxilin-based vehicle coatings**

### **8.1. Tools, auxiliary devices, expendable materials, health and safety equipment in the paint shop**

- 8.1.1. Surface preparation
- 8.1.2. Equipment to generate compressed air
- 8.1.3. Spray paint tools and accessories
- 8.1.4. Air exchange and exhaust systems
- 8.1.5. Tools for applying putties
- 8.1.6. Grinding tools and abrading products
- 8.1.7. Facilities for heating and forced drying
- 8.1.8. Polishing tools and compounds
- 8.1.9. Tools for striping and decorating
- 8.1.10. Lighting
- 8.1.11. Mixing equipment
- 8.1.12. Covering material and other additional means
- 8.1.13. Safety equipment and labour protection

### **8.2. Basic principles on surface coating systems on the bases of pyroxilin for the use on vehicle bodies after 1924**

### **8.3. The use of pyroxilin paint materials in the paint shop**

- 8.3.1. Primers
- 8.3.2. Base coats for spraying application
- 8.3.3. Block primers
- 8.3.4. Putties
- 8.3.5. Fillers
- 8.3.6. Pigmented topcoats
- 8.3.7. Clearcoats
- 8.3.8. Pigment concentrates and coloring systems
- 8.3.9. Thinners
- 8.3.10. Striping colors
- 8.3.11. Additional materials and products for the paint shop

### **8.4. Operational procedures for spray-painting vehicle bodies with pyroxilin materials**

### **8.5. Individual operations and application of different materials in the coating process**

### **8.6. Refinishing**

### **8.7. Processing defects in the application of pyroxilin coatings**

## **9. Advantages and disadvantages of pyroxilin paints**

- 9.1. The characteristic features of pyroxilin coatings in the context of using a vehicle
- 9.2. Chemical backgrounds concerning durability, aging and deterioration of pyroxilin vehicle coatings

## **10. Vehicle coatings formulated on the bases of synthetic resins**

### **10.1. Historical overview and basic chemical principles**

### **10.2. Application of vehicle coatings on the bases of synthetic resins**

### **10.3. "Combination paints"**

### **10.4. Refinishing with synthetic resin paints**

### **10.5. Characteristic features of synthetic resin vehicle paints**

## **11. Vehicle coating materials after 1945**

- 11.1. 1940 – 1950s
- 11.2. 1960s
- 11.3. 1970s
- 11.4. 1980s and 90s
- 11.5. Research and development in the field of vehicle coatings at the beginning of the 21st Century

## **12. Color for the motor vehicle**

- 12.1. Color fashions
- 12.2. The color of speed
- 12.3. Standardized color
- 12.4. “Arts Decoratifs et Industriels Modernes”

## **IV. Formulation and production of cellulose nitrate vehicle paints**

### **1. Cellulose nitrate, a historical overview until 1918**

- 1.1. Basic principles, nomenclature
- 1.2. Early research on cellulose nitrate
- 1.3. Early practical applications of cellulose nitrate
- 1.4. The first coating materials on the bases of cellulose nitrate
- 1.5. Wider adoption of cellulose nitrate products during World War I
- 1.6. Research for “low-viscosity types” of cellulose nitrate

### **2. The Ingredients of cellulose nitrate based coating materials**

- 2.1. **Cellulose nitrate**
  - 2.1.1. Chemical basics on cellulose
  - 2.1.2. Chemical bases on the esterification of cellulose with nitric acid
  - 2.1.3. Nomenclature of cellulose nitrates
  - 2.1.4. Viscosity of dissolved cellulose nitrates
  - 2.1.5. Raw materials for the production of cellulose nitrates in the first half of the 20th Century
  - 2.1.6. Procedures in the production of cellulose nitrates in the first half of the 20th Century
  - 2.1.7. Subsequent processing of cellulose nitrates
  - 2.1.8. Problems and causes of material defects in the processing of cellulose nitrates
  - 2.1.9. The production of low-viscosity types of cellulose nitrates for the paint industry
  - 2.1.10. Large-scale industrial processing at the end of the 1920s in the USA
  - 2.1.11. Basic principles on the uses of different types of cellulose nitrates
- 2.2. **Resins**
  - 2.2.4. Basic principles on the combination of cellulose nitrates with resins
  - 2.2.5. Copals
  - 2.2.6. Rosin and products produced thereof
  - 2.2.7. Dammar and products produced thereof
  - 2.2.8. Shellac
  - 2.2.9. Polyester resins, alkyd resins
    - 2.2.9.1. Non-drying alkyd resins
  - 2.2.6.1. Heat-convertible alkyd resins
  - 2.2.6.2. “Air drying” alkyd resins
  - 2.2.6.3. Variations and combinations of different types of alkyd resins
  - 2.2.10. Maleic resins
  - 2.2.11. Other resins

- 2.3. **Solvents and dilutents**
  - 2.3.1. The production of solvents before World War I
  - 2.3.2. Wood spirit, fusel oil and other distillation products from wood as sources for new developments in the field of solvents
  - 2.3.3. Acetone as sources for new developments in the field of solvents
  - 2.3.4. Ethanol as sources for new developments in the field of solvents
  - 2.3.5. Mineral oil and derivatives of coal as sources for new developments in the field of solvents
  - 2.3.6. Ongoing innovations in the field of solvents between 1925 and 1945
  - 2.3.7. The use of solvents and dilutents in pyroxilin paints
  - 2.3.8. Basic principles on dissolving the different components of the binding media
  - 2.3.9. Basic principles on adjusting the volatile components in the formulation of pyroxilin media and working properties or defects resulting thereof
- 2.4. **Plasticisers and other additives in pyroxilin coating materials**
  - 2.4.1. Basic principles on the use of plasticisers
  - 2.4.2. Solvating plasticisers
  - 2.4.3. Non-solvating plasticisers
  - 2.4.4. Additives
- 2.5. **Pigments and filling compounds**
  - 2.5.1. Basic principles on pigments
  - 2.5.2. Pigments and filling compounds in pyroxilin vehicle coating formulations

### 3. **Industrial devices, facilities and procedures for the production of pyroxilin vehicle coating materials**

- 3.1. **Delivery and storage of raw materials**
- 3.2. **Production of paints, basecoats and putties**
  - 3.2.1. Production of the clear binding media
  - 3.2.2. Incorporation of pigments and filling compounds
  - 3.2.3. Canning and delivery
  - 3.2.4. Laboratory and testing facilities

## V. **Appendices**

- a. **Bibliography and references on pictorial sources**
- b. **About the author**
